

# SOAP Condition Entry Information

TANGO's Concert API allows integration with 3<sup>rd</sup> party systems. This ensures up-to-date data is in sync between TANGO and users' systems.

For example, Condition Entry details or repair information can be synced through the Concert API to ensure TANGO's data is consistent with the user's system data.

To do this, TANGO uses SOAP webservices to communicate with user-created webservices. Typically, users will set up a request webservice as well as a response webservice.

With the Concert API, both TANGO and the user's system may initiate requests for information. The other system will respond to the request.

Below are the Condition Entry requests/responses available through Concert API.

## Condition Entries

- [Check Off](#)
- [Check Off by Condition Entry GUID](#)
- [Condition Entries by Modification Time Range](#)
- [Condition Entries by Modification Timestamp](#)
- [Fetch Condition Entry Attribute Values](#)
- [Get Condition Entry Attribute Type Names](#)
- [Get Open Condition Entries](#)
- [Get Open Condition Entry Info Without Work Order Number](#)
- [Set Condition Entry Attribute](#)
- [Set Condition Entry Attribute by Work Order](#)
- [Set Condition Entry Value](#)
- [Set Work Order by Work Request](#)
